Based in Moscow • Available for remote work • 14+ years of IT experience

ABOUT ME

DevOps / Platform Engineer and technical leader with 14+ years of experience in system administration, infrastructure automation, and internal platform engineering. I began in system administration and later moved into architecture and team leadership.

My key strength is transforming chaotic infrastructure and manual processes into a standardized, resilient platform.

I design and develop Kubernetes clusters, including isolated and regulated environments, as well as CI/CD systems, Infrastructure as Code, observability, and operational processes.

I have experience leading DevOps teams of up to seven people, including hiring, individual development plans, and process design.

I work effectively both in a hands-on capacity and at the level of technical strategy.

In my recent projects, I reduced cloud costs by 30%, shortened the time to launch a new service from three weeks to two days, and reduced the average time to resolve infrastructure issues from three days to three hours. I am experienced in working with infrastructure in isolated environments, including personal-data protection requirements.

KEY SKILLS

Orchestration and containerization: Kubernetes, Helm (including umbrella and library charts), ArgoCD, Istio, Docker, Fleet.

ML/LLM infrastructure: vLLM, Langfuse, Qdrant, deployment and monitoring of AI services.

Platforms and databases: Linux (RED OS), PostgreSQL (HA), Nginx, LDAP, Yandex Cloud, Google Cloud (GKE, Cloud SQL).

Leadership: Technical strategy, team leadership, hiring, FinOps, process documentation, and delivering training sessions.

CI/CD and IaC: GitLab CI, GitOps, Terraform, Ansible, Architecture as Code.

Observability: Prometheus, Grafana, logging, tracing, alerting, SRE practices, Monitoring as Code.

Development and automation: Python, Bash, ChatOps (Python/Slack), Apache NiFi.

EDUCATION AND LANGUAGES

ITMO University — Incomplete higher education, Information and Communication Technologies (prediction and prevention of emergencies), 2010.

Languages: Russian — native; English — B2 (Upper-Intermediate).

WORK EXPERIENCE

DevOps Lead — Nextbi

October 2024 — August 2026 · Moscow, nextbi.ru

Project description. A no-code integration platform for business-process automation and analytical data pipelines, delivered to isolated environments. Part of the core team, with one Senior DevOps Engineer reporting to me.

Project stack. Infrastructure: Kubernetes, Terraform, Ansible, Fleet, Helm, LDAP, RED OS. ML/LLM: vLLM, Langfuse, Qdrant. Development: Java, Kotlin, TypeScript, React, Python.

Responsibilities and achievements. Responsible for the technical strategy of the DevOps function and the infrastructure aspects of the architecture. Designed and implemented CI/CD, SRE, FinOps, Infrastructure as Code, and ChatOps practices. Developed infrastructure for LLM inference (vLLM, Langfuse, Qdrant). Migrated the product to RED OS and centralized access management through LDAP. Developed platform installation automation (an ISO image with a web interface) and a dynamic environment system.

- Within the first two months, built an automated platform designed to support up to a tenfold increase in load without a proportional increase in operating costs.
- Moved the infrastructure from manual management and dependency on individual specialists to a standardized IaC-based platform.
- Accelerated frontend builds by 7x, reducing build time from 1.5 hours to 12 minutes.
- Established a controlled release process using an umbrella Helm chart and unified pipeline templates; automated release builds, including automated tests, changelogs, and publication to Confluence.
- Designed a backup system, environment migration solution, and internal ChatOps tool.

Head of IT — SberEducation

October 2023 — October 2024 · Moscow

Project description. Internal development platform and production infrastructure. Rebuilt the DevOps team from scratch after the previous team left entirely.

Project stack. Infrastructure: cloud infrastructure, Kubernetes, CI/CD, monitoring systems. Development: Java, TypeScript, React, Python.

Responsibilities and achievements. Led a team of 6–7 DevOps engineers, including process design, individual development plans, and hiring. Responsible for production infrastructure, operational processes, and the release cycle. Coordinated collaboration with development, MLOps, DBA, and information security teams. Developed and presented the target infrastructure architecture to architects.

- Reduced the time to deploy a new service from three weeks to two days.
- Reduced the average time to resolve infrastructure issues from three days to three hours.
- Reduced cloud infrastructure costs by up to 30%.
- Implemented a Monitoring as Code approach, created a knowledge base, and established an onboarding program.
- Reduced regression issues by bringing development and production environments closer together.

Senior Information Systems Automation and Deployment Engineer — Bimeister

January 2022 — October 2023 · Moscow, bimeister.com

Project description. A digital model of industrial enterprises and a digital ecosystem for designing, constructing, and operating assets. Company infrastructure architecture and client solutions.

Project stack. Infrastructure: Kubernetes, Ansible, HA PostgreSQL, Apache NiFi, Prometheus, Grafana. Development: C#, TypeScript, React, Python (ChatOps).

Responsibilities and achievements. Administered multiple Kubernetes clusters and participated in the migration from Docker-based deployment to Kubernetes. Automated CI/CD, backup, monitoring, and logging processes. Delivered internal training sessions.

- Accelerated CI/CD pipelines by 3x while the number of tasks in core pipelines grew from 10–15 to 50–80.
- Developed an Ansible-based deployment package for deploying a highly available Kubernetes cluster, monitoring stack, and HA PostgreSQL, reducing implementation effort by 3–4 days.
- Created a unified CI/CD template and library Helm chart, reducing new repository creation time to 25 minutes.
- Participated in decomposing a monolith into microservices, resulting in more than 20 repositories.

DevOps / Team Lead — cart.is

October 2019 — January 2022 · Moscow, cart.is

Project description. A multi-cloud SaaS solution (startup). Migration of a Windows monolith to microservices.

Project stack. Infrastructure: Kubernetes (Kubespray, GKE), MS SQL, GitLab CI, Terraform, Helm, Office 365. Development: C#, PHP, TypeScript.

Responsibilities and achievements. Built the infrastructure from scratch. Led a team of up to six people and was responsible for application and infrastructure architecture. Managed all web-related operations, including DNS, domains, and certificates.

- As team lead and application architect, designed and brought to release a product for creating and displaying an enriched feed of supplementary information in a video-streaming service.
- Deployed a multi-domain Kubernetes environment, migrated the monolith to microservices, and set up a complete CI/CD cycle with testing and automated task creation.

Early Career (Before 2019)

Six years of experience in system administration.

Senior System Administrator — OpenTrade IT (2016–2019). Built a call center (IP telephony, Asterisk), migrated the company to an Active Directory domain, deployed GitLab with CI, set up monitoring (Docker, Prometheus, Grafana), and migrated hosting from Windows Server to Docker Swarm.

Also worked as a system administrator at IBS-FORWARDING, Sendika Group, Processing Technologies, and others.
